Spotlight on Research

The **Burgers Lab** studies DNA replication and DNA damage response in eukaryotic cells. Using yeast as a model organism, the lab integrates the biochemical analysis of DNA-protein interactions in purified model systems with the genetic analysis of targeted yeast mutants. Specific areas of interest are lagging strand DNA replication and Okazaki fragment maturation, damage induced mutagenesis, and DNA damage cell cycle checkpoints.

Right: DNA replication fork and Okazaki fragment maturation

The Modern Counseling Solution

Take the first step towards leading a healthy,
happy life anywhere, anytime, any place.

NexGen is a FREE and CONFIDENTIAL benefit provided by your university to help you overcome your personal challenges and emotional stressors. Now, you can start counseling requests via text message, live chat, or by using the NexGenEAP mobile app.

Counseling services include:

- Immediate Connection to a Mental Health Professional

- Mental health counseling for issues like depression, anxiety, grief, stress, and work related challenges

- Up to 6 sessions of counseling for each unique issue, every year

- Access to free in-person, telephonic, or video sessions with a counselor based on the challenge you are experiencing

Get Connected with a Mental Health Professional
in more ways than ever before

Text or Call
1.800.327.2255

Live Chat Online at
www.nexgeneap.com

Use the NexGenEAP
Mobile App

Congratulations to Dr. Holehouse

Oct 1st 2022 - **Alex Holehouse**, assistant professor of biochemistry and molecular biology has received more than \$450,000 in funding from the National Science Foundation (NSF) to lead a five-year project titled ***"Molecular engineering to understand desiccation protection and water responsiveness."*** The project is part of a larger grant called "Life without water: protecting macromolecules, cells, and organisms during desiccation and rehydration across kingdoms of life." This grant establishes the Water and Life Interface Institute led by Carnegie Science. The new initiative includes collaborators from at least nine research institutions nationwide.

Spotlight on Research

The **Galburt Lab** strives to understand the physical mechanisms of transcription initiation and other important DNA-protein interactions. More specifically, we use a variety of single-molecule and ensemble biophysical techniques including both optical and magnetic tweezers and fluorescent microscopy to investigate how the assembly of initiation complexes on gene promoters leads to DNA unwinding and transcription. Our work is currently focused on the mechanisms of basal transcription initiation in Eukaryotes and on factor-regulated transcription in *Mycobacterium tuberculosis*.

Spotlight on Research

The **Niemi Lab** investigates how mitochondria are built, regulated, and maintained across physiological contexts. We blend biochemistry, systems biology, and physiology to understand mechanisms of mitochondrial regulation and how they influence metabolism and organellar function. Using insights gained from our molecular studies, we aim to understand how mitochondrial dysfunction contributes to mammalian pathophysiology, with the long-term goal of translating our discoveries into new therapeutic options to restore mitochondrial function in human disease.

Back Up Your Stuff!

Are your files backed up?

If you are not keeping your files on a network file server, running a local backup client, or utilizing cloud storage, then it is possible that your files are **not** backed up!

**Want to make sure your data is backed up?
We provide several backup solutions.**

Spotlight on Research

The **Cooper Lab** is interested in how the actin filaments in cells assemble and how that assembly controls cell shape and movement. One focus is an actin-binding protein called "capping protein," which caps one end of the actin filament. Capping protein is in turn regulated by intrinsically disordered regions of the CARMIL family of proteins, which exhibit positive linkage in their binding interactions.

Spotlight on Research

Research in the **Lohman Lab** focuses on obtaining a molecular understanding of the mechanisms of protein-nucleic acid interactions involved in DNA metabolism, in particular, DNA motor proteins (helicases/translocases) and single stranded DNA binding proteins. Thermodynamic, kinetic, structural and single molecule approaches are used to probe these interactions at the molecular level.

Congratulations to Dr. Holehouse

Oct 1st 2022 – **Alex Holehouse**, assistant professor of biochemistry and molecular has received \$380,000 in funding from the Human Frontiers Science Program (HFSP) to lead a three-year project titled "***Molecular determinants of evolutionary conservation in disordered protein regions***". This project will integrate computational and experimental approaches to uncover who intrinsically disordered protein regions evolve. The proposal involves co-investigators Dr. Hyun Kate Lee (University of Toronto, CA) and Dr. Dolf Weijers (Wageningen University, NL).

**Congratulations to Anna Damato for being selected as the
2022 Ceil M. DeGutis Prize Fellow**

Anna Damato is a fifth-year PhD candidate in Neuroscience in the Department of Biology. Anna was nominated for this award by her thesis mentor, Dr. Erik Herzog, in whose lab she is connecting the bench to the bedside by investigating mechanisms of glioblastoma brain tumor circadian rhythms and how they impact the efficacy of chemotherapy. Anna uses real-time bioluminescence reporters of circadian gene expression to analyze the effects of timed treatment, with the goal of maximizing anti-tumor effects and minimizing side effects of chemotherapy in treating an otherwise dismal disease.

Spotlight on Research

The **Bowman Lab** seeks to understand the distribution of different structures a protein adopts and how this ensemble determines a protein's function. Examples of ongoing research projects include 1) understanding how mutations in the enzyme beta-lactamase change its specificity without changing the protein's crystal structure, 2) designing allosteric drugs, and 3) developing algorithms for quickly building models of the different structures a protein adopts.

Spotlight on Research

The **Greenberg Lab** focuses on how cytoskeletal motors function in both health and disease. Currently, the lab is studying mutations that cause familial cardiomyopathies, the leading cause of sudden cardiac death in people under 30 years old. The lab uses an array of biochemical, biophysical, and cell biological techniques to decipher how these mutations affect heart contraction from the level of single molecules to the level of engineered tissues. Insights into the disease pathogenesis will guide efforts to develop novel therapies.
